

False Claim Denied

False information, distributed by a competitor, was generated from erroneous and unverifiable information, stating CHLOR*RID contains anionic salts, such as fluoride and bromide. This is completely false.

CHLOR RID contracted an independent laboratory to conduct Ion Chromatography trace element analysis of our product. Of concern was the need to determine the presence of anionic species, other than those predominantly tested (chloride, sulfate and nitrate) for during surface preparation.

The trace analysis on CHLOR*RID show:

Fluoride: <1 ppm

Bromide: <1 ppm

(IC equipment resolution of <1 ppm)

CHLOR RID International, Inc. takes pride in our manufacturing controls and processes to ensure customers receive high quality products. CHLOR*RID is used during surface preparation to cost effectively decontaminate surfaces of soluble salts, which are a leading cause of premature coating failure.
