Soluble Salts Cleaners and Surface Treatments

Carboline recognizes the need and use of industrial cleaners for the removal of soluble salts and surface treatment processes. We have long approved their use with atmospheric coating systems and have continued evaluating their expanded use.

Carboline has tested the use of numerous brands of soluble salts and surface treatments with a variety of tank linings in immersion service. The testing consisted of different linings, commodities, and temperatures. The results showed no adverse effects on the chemical resistance performance of the lining systems.

With this supporting information, Carboline approves the use of these cleaning agents with all our coatings and linings. The manufacturer chemicals tested include HoldTight (including HoldTight 102), Chlor-Rid (including Soluble Salt Remover and SP8 Gel and SP8 Rinse), and Corrosion Innovation.

If you have questions or problems, please contact your local Carboline Sales Representative or Carboline Technical Service.
